

Jeremy Brown

AI / Python Engineer | LLM Tooling, Integration, and Cross-Platform Systems

Email: contact@jeremyb.dev | **GitHub:** github.com/JeremyB-py

Portfolio: www.jeremyb.dev | **Location:** St. Louis, MO (Open to remote)

Summary

AI-focused Python developer building LLM-enabled tools, integrated systems, and cross-platform applications. Platform-agnostic across AI providers and coding agents, with experience in provider routing, tool execution, structured outputs, local inference, and evaluation. Comfortable entering unfamiliar systems, testing assumptions, seeking feedback, and learning new technologies quickly. Uses AI-assisted workflows to accelerate development while retaining ownership of architecture, validation, debugging, security, and release decisions.

Technical Skills

Languages & Systems: Python, FastAPI, Pydantic, PostgreSQL/SQL, REST APIs

AI & LLM Systems: OpenAI/Anthropic APIs, Ollama, Hugging Face, Provider Routing, Tool Calling, Evaluation

Cross-Platform Product: Rust, Tauri, Kotlin, Svelte, JavaScript, HTML/CSS

Tools & Platform: Git, Docker, Cursor, Codex, Claude Code, CI/CD, Railway, Cloudflare, Ubuntu

Projects

Zap - LLM Provider Routing and Tool Execution (Open Source)

- Merged 3 PRs to zerx-lab/zap implementing BYOP agent tool execution by extracting JSON from model text and passing structured calls into the terminal tool pipeline.
- Fixed provider routing and request failures across OpenAI Responses API, Ollama, and Anthropic through URL normalization, endpoint tracing, and integration debugging.

ClipSpan - Cross-Platform Clipboard Sync and History

- Building Android, Linux, and Windows clipboard sync with a Kotlin/FlorisBoard keyboard, Rust/Tauri + Svelte desktop client, QR pairing, local history, and image/blob sync.
- Designed explicit Send Clip / Paste-first behavior, opt-in auto-sync policies, and an optional end-to-end encrypted account relay for off-LAN delivery; validate agent-generated code, architecture, and platform behavior.

Wrinkle Witch Platform - Website, Backend, CRM, Booking, and Automation

- Built a production-style monorepo for a local esthetician: Cloudflare-hosted sites, FastAPI backend, Streamlit admin tools, Square OAuth/Bookings/Payments, role-based auth, and scheduled Railway jobs.
- Use AI-native workflows to decompose features, compare implementation approaches, debug cross-service failures, and refine tests while owning security boundaries, integrations, deployments, and final code decisions.

Additional AI Work

- Experimented with quantized Hugging Face inference and PEFT/QLoRA fine-tuning, checkpointing, and repeatable Q&A evaluation; prototyped CLAIP with source tracking, confidence scoring, replay, reevaluation, guardrails, and rollback.

Experience

Software Developer, Freelance & Independent Projects | 2025-Present

- Build Python services, LLM integrations, cross-platform apps, web systems, and automation from requirements through deployment.
- Use AI-assisted engineering to investigate unfamiliar systems, compare approaches, implement and debug solutions, and validate generated code while retaining ownership of technical decisions.

City Letter Carrier, United States Postal Service (USPS) | 2016-Present

- Managed high-volume routes independently with consistent accuracy and practical problem solving.
- Became a go-to technology resource for supervisors and coworkers, troubleshooting devices, software, access, and other technical issues.

Education

St. Louis Community College (coursework), 2013-2014 | **High School Diploma**, 2013
